TECH-SOCIOPRENEURSHIP (TSP) CLUB PROPOSAL

By Divina Minocha, Lavanya Gupta and Sara Hulyalkar | Year 11

Respected heads,

"Where Future Leaders Build AI-Powered Enterprises"

We would like to propose the creation of a new student-led initiative at DAIS, "The Tech-Sociopreneurship Club (TSP)", which combines entrepreneurship with social responsibility, community service and technology.

Idea: A club that integrates technology, specifically AI, into business applications, equipping students with the skills to leverage AI for optimising various business processes, all with the end goal of having a larger community impact.

Overview:

This club brings together two of the most vital forces shaping the future: business and technology, with a particular focus on artificial intelligence, entrepreneurship, and social impact. AI is the new literacy, by 2030, over 70% of business processes will integrate AI. Students will explore how different business departments operate, while simultaneously learning to use no-code AI tools to tackle real-world challenges. The twist? Every business idea will be rooted in socio-preneurship, creating solutions that address real community needs. By blending entrepreneurial thinking with purpose-driven innovation, members will design AI-powered projects that optimise business operations while delivering tangible social benefits. The journey will culminate in a formal pitch to a mock investor panel, modeled by 11th-grade students, simulating a real-world entrepreneurial environment and fostering creativity, critical thinking, and presentation skills, all while proving that innovation isn't just about profit, it's about making a difference.

Harvard, Wharton, and Stanford are already teaching AI + Business through case-based, research-led, hands-on projects. This club will replicate that MBA-style, problem-solving culture for high school.

Tentative Schedule

We aim to divide the learning outcomes of the club over semester 1 and semester 2.

Semester 1 will cover the following:

- Learning how a business works through case studies and real world examples
- Learning how to use different no-code AI tools
- Building an AI tool that can be used to optimise a particular business process
- Brainstorming a new product idea for students individually
- Teaching students how to present their product to an investor panel
- A mock investor panel modeled by the 11th graders where students can pitch their product incorporating AI that they have created

Semester 2 will cover the following:

- Introduction to social entrepreneurship + how social enterprises work
- Conducting market research and competitor analysis
- Hands-on work on students' individual products
- Teaching students how to manage different parts of a business such as fundraising, catering to a difficult audience, marketing, etc
- Collaboration with local NGOs or businesses that are working towards a similar goal
- Measuring social impact (analysis of scalability of the business)
- Digital marketing basics
- Learning communication devices and working on their pitch
- Final investor panel

Why this club?

We believe this club will be beneficial for numerous reasons:

1. Bridges two highly in demand skill sets in today's job market (AI/tech + business/entrepreneurship skills)
2. Enhances problem solving by encouraging students to think analytically to identify inefficiencies in business processes and design improvements
3. Improves accessible technology skills, making advanced technology like AI more accessible for students, regardless of their prior technology experience
4. Provides students with entrepreneurial experience by stimulating real-world startup culture through product development and investor-style pitching
5. Encourages collaboration and communication amongst students
6. Stimulates hands-on, practical learning by allowing students to design and implement real AI-driven solutions
7. Allows students to contribute to society in a meaningful manner and address real community challenges

Activities:

1. **Teaching students the different parts of a business:** This would include us teaching them how to make a formal business pitch, and what all should be included. Moreover, we would teach students how to use AI to optimize different parts of a business. This includes no-code AI tools which could be used to make chatbots, apps, websites. We would then teach the students how to use these tools in business, for example, a chatbot would help with 24/7 customer service and to help book appointments and schedules.

3. **Breaking down a company:** Students would have to reverse engineer a well-known company and break down their business model, revenue streams, the technology they use to earn profits

and their CSR (corporate social responsibility) to understand how they are making an impact in society.

2. Mock investor panel: students would have to come up with their own product which incorporates AI and present it to the 11th graders. They would have to think of all the different aspects of running a business like raw materials, revenue, what they do with the money we would invest, etc. In the end, the 11th graders would decide how much we would hypothetically invest in the companies, and provide feedback based on our experience. This activity would allow the students to discover the real-world requirements to create a product, the multiple persuasion/communication devices to be used for marketing their product, and how to effectively convey the incentive and end results of the product they are pitching to investors.

3. Customer Roleplay: A group of teachers or student mentors could pretend to be a difficult customer, and the mentees would have to try and sell their products to them, bringing in the entrepreneurship part of the club. This would help the students gain exposure and learn to cater to a demanding audience, teaching them how to market their product to investors in the most efficient and successful way possible.

4. Problem-fixing: The students could list social problems such as climate change, waste management, etc and then pick one and brainstorm tech-based fixes. This would teach them the process of coming up with a unique business model that is able to keep up with the ever-changing digital landscape and create an impactful tool for the community.

5. Fundraising Events: Members will conceptualize and organize creative fundraising events such as charity fairs, school-wide challenges, social impact showcases, and online campaigns, not just to raise awareness, but to generate the initial start-up capital for their own social enterprise ideas. This ensures every project is completely community-driven and supported.

6. Branding and marketing: Students will learn how to use various AI tools such as Canva AI to create their logo, ad copies and social media campaigns. This activity would teach the members how to create marketing strategies that are able to bring in greater profits.

3. What outcome or goal do you see the members of this club achieving?

- Strengthen college applications by showcasing initiative, leadership, and a sustained commitment to social responsibility. (takes care of community service+ helps students build a passion project)
- Learning how to optimize AI tools to better the community as well as build a business
- Learning both the benefits and limitations of AI as a business assistant
- Develop the skills to turn a socially impactful idea into a viable start-up plan.
- Getting exposure to the curriculum in Harvard Business School and Wharton regarding entrepreneurship
- Learn how businesses (including social enterprises) work and how to deliver a formal business pitch
- Gain hands-on community service experience while pursuing a passion project.
- Build confidence in public speaking, pitching, and teamwork.
- Launch at least 3 community-impact projects per year that makes a measurable difference

Tab 2

AI for Business Optimization Club

"Where Future Leaders Build AI-Powered Enterprises"

1. Vision

To empower students with the ability to research, design, and implement AI-driven solutions for real business challenges, building a generation that understands both the technology and the strategy behind modern enterprises.

2. Why This Club?

- AI is the new literacy, by 2030, 70% of business processes will have AI integration.
- Most students know AI only as a “cool chatbot” ; few understand how to use it to solve real problems.
- Harvard, Wharton, and Stanford are already teaching AI + Business through case-based, research-led, hands-on projects.
- This club will replicate that MBA-style, problem-solving culture for high school.

3. Club Methodology: The AI Business Lab Model

We merge Harvard-style case teaching with hands-on, research-backed prototyping.

3.1. Research Phase (2–3 weeks)

- Students conduct literature reviews on AI applications in business verticals (Marketing, HR, Operations, Finance).
- Teams interview local entrepreneurs or alumni to identify real-world business pain points.
- Use research tools (Google Scholar, Perplexity, Scite.ai) to find case studies and benchmark solutions.

3.2. Application Phase (4–5 weeks)

- Each team becomes a “Business Pod” with one functional focus (e.g., Marketing or HR).
- Using no-code AI tools (ChatGPT, Claude, Midjourney, Pictory, Levity, SheetAI, Zapier), they prototype an AI-driven optimization for that function.
- Collect before–after metrics to measure the AI’s impact.

3.3. Presentation Phase (1 week)

- Harvard-style pitch day: teams present their business case, research findings, AI prototype, and ROI projection.
- Judges: school leaders, local entrepreneurs, and tech professionals.

4. Structure & Roles

Core Team:

- Club President & Vice President: Oversee operations, liaise with school & mentors.
- Research Lead: Guides research methodology & ensures credible sourcing.
- Tech Lead: Helps teams implement tools & troubleshoot.
- Outreach Lead: Coordinates guest speakers, industry connections.

Mentors:

- Seniors upskilled via a 2–3 week AI crash course.
- Guest lecturers (local AI professionals, alumni, entrepreneurs).
- Faculty advisor for supervision & resource allocation.

5. Club Deliverables

By the end of each term:

1. Research Portfolio — a collection of academic-style case briefs on AI in business.
2. Working Prototypes — no-code AI tools built for fictional or local businesses.
3. Impact Reports — data-backed analysis of the AI's business effect.
4. Pitch Event — “AI for Business Summit” where teams compete for the best solution.

6. Example Case Studies

- Case 1: Marketing Optimization
Scenario: A local café wants to boost weekday sales. Students use AI to generate ad creatives, schedule campaigns, and predict demand spikes.
Outcome: 25% projected increase in weekday visits.
- Case 2: HR Recruitment Screening
Scenario: A startup receives 300 internship applications. Students build an AI-assisted screening system to shortlist candidates based on skills & fit.
Outcome: 80% time saved for the HR team.
- Case 3: Operations Forecasting
Scenario: A school store faces frequent stockouts. Students create an AI-powered inventory forecast using sales history + seasonal trends.
Outcome: 15% reduction in missed sales.

9. Impact

- For Students: Critical thinking, business acumen, research skills, AI fluency.
- For School: Reputation for innovation, student success stories, potential competition wins.
- For Community: AI-powered solutions for local entrepreneurs and NGOs.

10. Long-Term Vision

- Turn the club into a hub for student-led AI consulting offering free solutions to local small businesses and NGOs.
- Publish an annual AI in Business Report authored by students.
- Partner with college clubs for mentorship pipelines.

sessions

Session 1 – AI Foundations & Business Context

Goal: Understand what AI is, where it fits in business, and how to think like an AI problem-solver.

Content:

- **What is AI?** Simple explanation of Machine Learning, NLP, Computer Vision.
- **Where AI is used in business:** Marketing, HR, Finance, Operations, Product.
- **The AI Mindset:** Framing problems for automation & optimization.

Hands-On:

- Write your **first effective prompt** in ChatGPT.
- Ask: “What are 5 AI tools a small café could use to increase weekday sales?”

Resources:

- Elements of AI – Intro Course (Free)
- Google AI for Everyone (Free)
- [ChatGPT Quick Start Guide](#)

Session 2 – Prompt Engineering & AI for Research

Goal: Learn how to communicate with AI effectively and validate information through research.

Content:

- **Prompt Structure:** Role + Context + Task + Constraints + Format.
- **Iterative prompting:** Refining outputs.
- **AI as a research assistant:** Summarizing articles, extracting data, finding case examples.

Hands-On:

- Create a **prompt template** for summarizing competitor analysis.
- Use Perplexity AI to research “AI in HR recruitment” and produce a one-page brief.

Resources:

- Learn Prompting
- Prompt Engineering Guide
- Perplexity AI

Session 3 – No-Code AI Tools for Business

Goal: Explore tools to implement AI without coding.

Content:

- **Marketing:** Canva AI, Pictory AI, Copy.ai
- **Data & Operations:** Google Sheets + SheetAI, Datawrapper

- **Automation:** Zapier, Make
- **Chatbots:** Tidio, Landbot

Hands-On:

- Create a **social media ad campaign** in Canva AI for a fictional business.
- Automate a lead capture → email response flow in Zapier.

Resources:

- No-Code AI Tools Directory
- Canva AI
- Zapier Quickstart

Session 4 – Data-Driven Decision Making

Goal: Use AI to analyze, visualize, and make business recommendations.

Content:

- **Data basics:** Cleaning, sorting, summarizing.
- **AI in Sheets:** Formula generation, data categorization, forecasting.
- **Visualization:** Charts that tell a story.

Hands-On:

- Import a small sales dataset into Google Sheets.
- Use SheetAI to forecast next month's sales & create a Datawrapper chart.

Resources:

- Google Sheets AI Functions
- Datawrapper Tutorials
- SheetAI

Session 5 – AI Ethics, Limitations & Pitch Prep

Goal: Understand AI's limitations, responsible use, and prepare for Harvard-style case pitches.

Content:

- **Bias & fairness in AI** (examples from recruitment, lending, policing).
- **Hallucinations & fact-checking.**
- **Pitching AI Solutions:** Structure – Problem → AI Solution → Benefits → Risks → ROI.

Hands-On:

- In groups, create a **mini AI proposal** for an NGO improving food distribution.
- Include: research insights, chosen AI tool, benefits, limitations, and next steps.

Resources:

- AI Ethics Guidelines – UNESCO
- The AI Ethics Canvas
- TED Talk – The Moral Bias Behind AI

Session 1 – AI in Marketing & Sales

Goal: Use AI to create campaigns, analyze customer behavior, and improve conversion.

Lecture:

- How AI powers digital marketing (ad targeting, content generation, customer segmentation).
- Real-world examples: Coca-Cola's AI ads, Netflix's recommendation engine.
- Research case: [Harvard Business Review – How AI is Changing Marketing](#)

Hands-On:

- Use **Canva AI** to design a campaign for a fictional product.
- Generate ad copy using Copy.ai or [ChatGPT](#).
- Create a simple **sales funnel diagram** in Miro or Canva.

Session 2 – AI in Human Resources

Goal: Streamline recruitment, onboarding, and employee engagement with AI.

Lecture:

- AI in CV screening, skill assessment, employee retention.
- Risks: Bias in hiring algorithms.
- Research case: SHRM – AI in HR Trends Report

Hands-On:

- Use **ChatGPT** to create a job description and candidate evaluation rubric.
- Simulate a candidate shortlist with Rezi AI Resume Screening.
- Role-play an AI chatbot interview using Tidio.

Session 3 – AI in Operations & Supply Chain

Goal: Optimize workflow, inventory, and logistics.

Lecture:

- Forecasting demand, automating inventory tracking, reducing downtime.
- Real-world example: Amazon's predictive inventory systems.
- Research case: McKinsey – AI in Operations

Hands-On:

- Import sample sales data into **Google Sheets + SheetAI** to forecast next month's demand.

- Build an automation flow in Zapier for stock alerts.

Session 4 – AI in Finance & Decision Support

Goal: Automate financial tasks and improve decision-making accuracy.

Lecture:

- AI for expense tracking, fraud detection, and forecasting.
- Predictive analytics for investment decisions.
- Research case: PwC – AI in Finance

Hands-On:

- Create a **cash flow forecast** using AI in Sheets.
- Use ChatGPT to generate a financial dashboard summary from raw numbers.
- Explore fraud detection simulation using DataRobot AI Cloud.

Session 5 – AI in Product & Customer Experience

Goal: Use AI to design products, personalize customer journeys, and increase retention.

Lecture:

- Generative design in product innovation.
- AI-powered personalization (Spotify, Amazon).
- Research case: MIT Sloan – Personalization at Scale with AI

Hands-On:

- Create a **chatbot prototype** for customer service in Landbot.
- Use **Midjourney** to generate product concept images.
- Design a basic recommendation system logic flow in Miro.
